

Nick Gorunov

Graduate Quant Researcher/Trader Candidate | Self-Taught Systematic Trading Researcher

LinkedIn: [linkedin.com/in/nickgorunov](https://www.linkedin.com/in/nickgorunov) | Evidence package: github.com/honeycomb-enjoyer/trading-snapshot

PROFILE

Self-taught trading researcher building a practical route into systematic trading through independent market work. I moved from discretionary trading toward an automated research and execution workflow, using AI-assisted coding heavily while staying transparent about my limitations. My current fit is a junior research/trading-support path where persistence, market curiosity, documentation, and careful testing matter.

FIT FOR NAYT TECHNOLOGIES

- Nayt's Graduate Quant Researcher/Trader role stood out because it welcomes applicants from all backgrounds, while still setting a high bar for quantitative ability and affinity with trading.
- The firm's expansion into European and US crypto venues, CME, US-listed ETFs, and traditional markets is a useful bridge to my work: my snapshot is built on more classical markets rather than crypto-specific strategies.
- I am interested in teams working across HFT market making, systematic mid-frequency, and DeFi, especially where risk management, databases, strategy control, execution, and analytics sit close together.

INDEPENDENT TRADING RESEARCH PIPELINE

Systematic Trading Research Snapshot - Personal Project | public evidence package

- Built a workflow for turning discretionary trading ideas into rules, backtests, assumptions, reports, and selected live execution with my own capital at risk.
- Created a three-strategy portfolio across continuation breakout, mean reversion, and a mean-reversion variant with a higher-timeframe filter.
- Currently gathering a track record for this portfolio and other ideas; I do not claim the work as proven production alpha.
- Documented execution assumptions, causal filters, overfitting concerns, portfolio behavior, drawdowns, reporting, and operational risks.

RELEVANT SKILLS

Research process	Hypothesis design, signal/execution separation, backtest review, robustness notes, portfolio/risk thinking.
Markets	FX, futures-like instruments, gold, mean reversion, breakout logic, higher-timeframe filters; active interest in crypto market structure and DeFi.
Tools	AI-assisted Python workflow, basic data analysis, Excel/spreadsheets, GitHub, Markdown research notes, evidence-package documentation.
Work style	Persistent, transparent about limitations, detail-oriented, comfortable with iteration, weak-signal rejection, and support tasks close to trading.

EDUCATION

Saint Petersburg State Forest Technical University - Standardization and Metrology
