

Trading Systems Evidence Package

Curated snapshot of self-built trading research and execution infrastructure. The package is evidence of engineering process, not an institutional track record or alpha marketing deck.

Research layer	Causal OHLC backtesting, execution-cost modeling, train/holdout metrics, Monte Carlo, permutation, walk-forward, strategy and portfolio reports.
Runtime layer	Sanitized MT5 hub runtime with one lifecycle owner, strategy registry, durable order intents, risk guards, ledger, reconciliation and read-only reporting.
Validation	trading_research: 88 passed. live_trading: 264 passed, 2 subtests passed. compileall passed for both modules.

End-to-End Pipeline

- Market data CSV -> UTC validation and data contract -> feature precompute
- Causal OHLC backtest -> execution cost model -> train / holdout metrics
- Robustness tests: Monte Carlo, permutation, walk-forward
- Strategy profile report -> portfolio profile -> selected strategy configs
- MT5 hub runtime -> risk guards and order intents -> ledger, reconciliation and live trade report

Fast Review Path

- Start with START_HERE.md in the repository root.
- Open sample strategy and portfolio reports under source_snapshots/trading_research/sample_reports.
- Open source_snapshots/live_trading/sample_reports/live_trade_report_sample.md for runtime reporting.
- Then inspect the key implementation files listed in START_HERE.md.

What To Evaluate

- Correctness boundaries: causal execution semantics and explicit transaction costs.
- State design: strategy identity, order intents, reconciliation, trade ledger.
- Operational judgment: account risk guards, kill switch, preflight checks and brokerless tests.
- Communication: human-readable research and runtime reports instead of only terminal output.

Repository Structure

START_HERE.md	Single entry point for reviewer path, pipeline, key files and validation.
EVIDENCE_PACKAGE_OVERVIEW.pdf	This one-page printable overview.
source_snapshots/trading_research	Offline research lab snapshot.
source_snapshots/live_trading	Sanitized live runtime snapshot.

Positioning: self-taught Python trading systems candidate with evidence in backtesting, market-data tooling, robustness validation, execution-cost modeling, reporting and brokerless MT5 runtime engineering.
